

POTENTIAL OF WINDOW DESIGN TO ENHANCE
NATURAL SMOKE VENTILATION PERFORMANCE IN
THE MALAYSIAN PUBLIC HOSPITAL BUILDINGS

BY

MOHD ZAID BIN AB GHANI

A thesis submitted in fulfilment of the requirement for the
Doctor of Philosophy (Built Environment)

Kuliyah of Architecture and Environmental Design
International Islamic University Malaysia

APRIL 2021

ABSTRACT

This thesis investigates the possibilities of improving natural smoke ventilation performance in public hospital buildings in Malaysia. In the hospital buildings, windows are the most common form of natural ventilation mechanism for thermal comfort and smoke ventilation. Natural smoke ventilation mechanism is to remove smoke, hot gases, and other effects of combustion in the case of a fire. Statistics on cases shows that numbers of catastrophic fire incidents in hospital buildings and other buildings reveal that smoke is the leading cause of deaths in the event of fires. Therefore, this research is conducted to investigate the possibility of windows design as means for natural smoke ventilation in public hospital buildings. In specific, the objective of this research is to investigate the effects of windows configuration in responding to the different wind directions on natural smoke ventilation performance. This research involves two stages. Firstly, the inventory exercise of three (3) selected public hospital buildings. This is to identify the wards and the windows design and, secondly, computer simulation using CFD software, FDS Version 6.3, to evaluate the existing windows configuration on natural smoke ventilation performance, and to evaluate the potential of the proposed windows configuration in enhancing the natural smoke ventilation performance. The analysis of fire and smoke behavior is conducted in 4-bed wards. The result shows that the existing windows configuration in the 4-bed wards is ineffective in safeguarding the life safety of patients as the Available Safe Egress Time (ASET) is below the Required Safe Egress Time (RSET) of 191 seconds. However, by increasing the size of the windows from 19 % to 22.73 %, the ASET for visibility and temperature increased by 113.7% and 76.47%, respectively. It is observed that the two models (M4 and M6) which are the vertical windows configuration with inlet louvers near the floor are able to serve as means for natural smoke ventilation strategy in public hospital buildings in Malaysia at 90° (parallel) wind direction. Thus, the findings of this research provide a guideline for fire and rescue departments, local authorities, healthcare providers, design professionals, and contractors in understanding, designing, constructing, and enforcing natural smoke ventilation design by means of windows design in the wards of public hospital buildings.

خلاصة البحث

تتحقق الرسالة من الفرص في تحسين أداء تهوئة الدخان الطبيعي في المستشفيات العامة في ماليزيا حيث تكون النوافذ هي الشكل الأكثر شيوعا لآلية التهوئة الطبيعية للراحة الحرارية والتهوئة الدخانية. تهدف آلية تهوئة الدخان الطبيعية إلى إزالة الدخان والغازات الساخنة وغيرها من آثار الاحتراق في حالة الحريق. تدل احصائيات الحالات على عدد من حوادث النيران المأسوية في مباني المستشفيات وغيرها يفيد بأن الدخان هو العامل السائد لسبب الوفاة في حوادث النيران. ولذلك يتم إجراء هذه الدراسة للتحقق من احتمال تصميم النوافذ كآلية لتهوئة الدخان الطبيعية في المستشفيات العامة فيكون هدف البحث هو لدراسة آثار تركيب النوافذ في الرد على اتجاهات الرياح المختلفة التي تؤثر على أداء الدخان الطبيعي. تتم الدراسة في مرحلتين أولهما جرد الأصول المادية لثلاث من المستشفيات العامة من أجل معرفة تصميم عنابرها ونوافذها وثانيهما إجراء المحاكاة الحاسوبية باستخدام تطبيق ديناميكا الموائع الحاسوبية نسخة ديناميكا الحريق الحاسوبية ٦.٣ من أجل تقويم تركيب النوافذ الحالية وآثاره على أداء التهوئة الطبيعية للدخان وكذلك للتحقق من إمكانية اقتراح تركيب بديل للنوافذ في تطوير أداء التهوئة الطبيعية للدخان. تم تحليل النيران وسلوك الدخان في عنابر ذات أربعة أسرة. تدل النتائج على أن التصميم الحالي للنوافذ في العنابر ذات أربعة أسرة غير فعال في حماية سلامة المرضى لأن الوقت المتاح للخروج كان متدنيا من الوقت الآمن للخروج وهو ١٩١ ثانية. ولكن من خلال زيادة حجم النوافذ من ١٩٪ إلى ٢٢.٧٣٪ يزداد فرصة الخروج ووضوح الرؤية إلى ١١٣.٧٪ و٧٦.٤٧٪. ويلاحظ أن النموذجين إيم ٤ و ٦ وهما التركيب العمودي مع النوافذ الداخلية بالقرب من الأرضية يمكن أن يكون وسيلة لاستراتيجية التهوئة الطبيعية للدخان في مباني المستشفيات العامة في ماليزيا ل ٩٠ درجة من اتجاه الرياح الموازي. وبهذا تزود نتائج هذه الدراسة مبدأ توجيهيا لأقسام الدفاع المدني والسلطات المحلية ومزودات الخدمات الصحية ومحترفي التصميم والمقاولين في الفهم والتصميم والإنشاء ولتطبيق لتصميم تهوئة الدخان بواسطة تصميم النوافذ في عنابر المستشفيات العامة.

ACKNOWLEDGEMENT

All glory is due to Allah

First and foremost, I deeply grateful to Allah Almighty for his mercy, guidance, and granted me sufficient strength to accomplish this study. I also express my thanks and gratitude to the Holy Prophet Muhammad (May Allah blesses, and peace be upon Him) for His sacrifice and effort to spread Islam on this earth.

I want to express my sincere thanks to my supervisors, Prof. Ar. Dr. Abdul Razak bin Sopian, Asst. Prof. Ar. Dr. Srazali bin Aripin and Ir. Mohd Sharifuddin bin Ibrahim for their valuable supervision, encouragement, advice, comments, and close friendship throughout the study. Their professional experience and vast knowledge in the built environment and building architecture helped me a lot to complete this thesis.

I also would like to express my great gratitude to the Public Services Department, Malaysia, and the Fire and Rescue Department, Malaysia, for awarding a scholarship and permission for me to further this study. I also acknowledge the officers at the Ministry of Health, Malaysia, and the Malaysian Meteorological Department (Met Malaysia) for their information and permission to access some valuable documents and data for this study.

A particular word of thanks to the officers at Selayang Hospital, Serdang Hospital, and Selayang Hospital. Especially Encik Nor Azman bin Ramli, Encik Amir bin Razali, Rohana binti Junaidi, respectively, for their support and close assistance during my data gathering at the hospital buildings. Also, I would like to express my gratitude to Ir. Leong Peng Seng, Dato' Imran bin Ibrahim, and Encik Amir bin Rafie for their efforts to introduce and train me on using fire simulation software used in this study.

Thanks to my friends at the fire and rescue department, Malaysia. Thanks for your assistance and opinions, especially Tuan Iskandar bin Zulkarnain, Encik Ismail bin Sabri, and Tuan Esmadi bin Ashari. Their contributions in providing data and information for my study are highly appreciated.

Finally, my deepest gratitude goes to my beloved wife, Mastura binti Zakaria, and children for their endless support, motivation, understanding, and sacrifice during my study. Also, to my parents, I would like to present my utmost thankful for their constant prayers and motivation for the completion of my study. This thesis is dedicated to all of you with all of my heart and soul.
