

CYTOTOXICITY OF *Eurycoma longifolia*, *Nigella sativa*
AND *Hibiscus sabdariffa* ON
CERVICAL AND OVARIAN CANCER CELL LINES

BY

‘AFIF RAIHAN BINTI ABDULLAH

A thesis submitted in fulfilment of the requirement for the
degree of Master of Health Sciences

Kulliyyah of Allied Health Sciences
International Islamic University Malaysia

JANUARY 2019

ABSTRACT

Cervical and ovarian cancers are the lethal gynaecological malignancies that affect the local health scene among women. *Eurycoma longifolia*, *Nigella sativa* and *Hibiscus sabdariffa* are widely used as herbal remedies and natural supplements in Malaysia. The current study is designed to investigate the cytotoxic effects of standardised quassinoid *E. longifolia* (TAF 273), *N. sativa* (NSE) and *H. sabdariffa* (HSE) extracts on cervical cancer (HeLa) and ovarian cancer (Caov-3) cells and the mechanism of cell death. The cytotoxicity of TAF 273, NSE, and HSE were evaluated using MTT assay and the mode of cell death was detected by Hoechst 33258 nuclear staining. The analysis of apoptosis and cell cycle arrest were assessed via flow cytometry. The gene expression of *Bax*, *Bcl-2* and *caspase-3* were investigated through real-time PCR. The findings showed that TAF 273 suppressed the cell growth of Caov-3 with the lowest IC₅₀ value (5.3 µg/mL), comparable to the cisplatin (IC₅₀ value of 6.07 ± 1.87 µM; ~6.1 µM). The IC₅₀ values of TAF 273 on HeLa as well as NSE and HSE on both Caov-3 and HeLa were however not identified. TAF 273 and cisplatin showed no toxicity on normal human ovarian surface epithelial cells (nHOSEpiC). The characteristics of apoptosis such as cell shrinkage, chromatin condensation and nuclei fragmentation were found following TAF 273 and cisplatin treatment. The flow cytometry analyses showed that TAF 273 and cisplatin induced the apoptosis on Caov-3 in dose- and time-dependent manner and arrested the cell cycle at G₂ phase. The real-time PCR results showed that TAF 273 down-regulated the *Bax*, *Bcl-2*, and *caspase-3* expression. Meanwhile, cisplatin up-regulated the *Bax* and *caspase-3* and down-regulated the *Bcl-2* expression. Results from this study suggests that TAF 273 was cytotoxic on Caov-3 cells through the induction of the apoptosis via the mitochondrial pathway, initiated by proteins other than *Bax* and it was executed through other group of executioner caspase or via caspase-independent pathway. The output of this study may indicate the potential of the standardised quassinoid of *Eurycoma longifolia* extract in the successful treatment of ovarian cancer as part of cancer therapy.

خلاصة البحث

سرطان عنق الرحم وسرطان المبيض هي أورام خبيثة قاتلة تؤثر على الصحة المحلية بين النساء. يتم استخدام اليوركوما لونغيفوليا، والنايجيلا ساتيفا، والهيبسكوس سابادريفيا على نطاق واسع كعلاجات عشبية ومكملات غذائية طبيعية في ماليزيا. تم تصميم الدراسة الحالية للتحقيق في السمية الخلوية لليوركوما لونغيفوليا (TAF 273) والنايجيلا ساتيفا (NSE)، والهيبسكوس سابادريفيا (HSE) ضد سرطان عنق الرحم (HeLa) وسرطان المبيض (Caov-3) وكيفية آلية موت الخلايا التي تؤثر عليها. تم تقييم السمية الخلوية لـ TAF 273، وNSE، وHSE باستخدام فحص MTT، وتم الكشف عن آلية موت الخلية بواسطة التلوين النووي Hoechst 33258. تم تقييم تحليل موت الخلايا المبرمج ودورة الخلية عن طريق اختبار التدفق الخلوي. تم التحقيق في التعبير الجيني لـ *Bax*، و*Bcl-2*، و*caspase-3* باستخدام PCR الوقت الحالي. أظهرت النتائج أن TAF 273 قامت بتثبيط نمو خلايا Caov-3 بأقل معدل للـ IC_{50} (5.3 ميكروغرام/مل) مقارنة مع السيسبلاتين (قيمة IC_{50} حوالي 6.1 ميكرومولار). لم يتم تحديد قيم IC_{50} للـ TAF 273 على HeLa وNSE وHSE على كل من Caov-3 وHeLa. لم تظهر TAF 273 والسيسبلاتين أي سمية على الخلايا الطلائية للمبيض البشري الطبيعية (nHOSEpiC). تمت ملاحظة صفات موت الخلايا المبرمج مثل الانكماش الخلوي وتكثف الكروماتين وتجزئة النواة بعد علاج الخلايا بالسيسبلاتين والـ TAF 273. أظهرت تحاليل التدفق الخلوي أن TAF 273 والسيسبلاتين سببا موت الخلايا المبرمج على Caov-3 بطريقة تعتمد على الجرعة والوقت وأوقفت دورة الخلية في المرحلة G2. أظهرت نتائج PCR الوقت الحالي أن TAF 273 قد قام بالتنظيم التخفيضي لبروتينات *Bax*، و*Bcl-2*، و*caspase-3*، في حين قام السيسبلاتين بالتنظيم الرفعي للـ *Bax*، و*caspase-3*، و*Bcl-2*. أشارت نتائج هذه الدراسة إلى أن TAF 273 كان ساما خلويا على Caov-3 عن طريق تنشيط موت الخلايا المبرمج عبر مسار الميتوكوندريا والتي تم بدؤها من قبل جينات أخرى غير *Bax* وتم تنفيذها من خلال المسار المستقل عن *caspase-3*. تشير نتائج هذه الدراسة إلى إمكانية مركب الكوسينويد المعياري لمستخلص اليوركوما لونغيفوليا في معالجة سرطان المبيض بنجاح وذلك كجزء من علاج السرطان.

APPROVAL PAGE

I certify that I have supervised and read this study and that in my opinion, it conforms to acceptable standards of scholarly presentation and is fully adequate, in scope and quality, as a thesis for the degree of Master of Health Sciences.

ACKNOWLEDGEMENTS

All praises to *Allah SWT* The Most Gracious and The Most Merciful for blessing me with the chance of completing this master study. There were ups and downs throughout this journey and I am much grateful for every steps I have made.

With full of gratitude and respect, I would like to thank my supervisor, Assoc. Prof. Dr. Suzanah Abdul Rahman and my co-supervisor, Asst. Prof. Dr. Mohamad Arifin Kaderi, fellow lecturers, my research teammates, Sr. Amalina, Sr. Nadia and Sr. Syazana and all my postgraduate colleagues for their constructive ideas and guidance, motivations and critics, and for bringing this study into success.

With full of my heart and boundless love, I would like to extend my heartfelt gratitude to my backbone; my mom, dad and my family for the unceasing support and encouragement. They are the best support system I have ever had in my life. And I would like to thank my loving husband, Mohamad Zaid, who is my champion, who blessed me with joys and brings me lights.

With huge appreciation, I would like to express my unlimited thanks to the good facilities and assistance that I have received along the study in International Islamic University Malaysia, Kuantan Campus. I really appreciate how the lab officers and researchers of the Centre Research and Animal Facility Management (CREAM) and Research Laboratory, Kulliyah of Allied Health Sciences have been so helpful and supportive towards my research. Thank you for the generous knowledge and guidance that have been shared.

With deep recognition, I would like to thank Ministry of Agriculture and Agro-based Industry Malaysia for granting NKEA Research Grant Scheme (No: SP15-061-0183) for this study. Without this financial support this study will never come into existence.

May *Allah SWT* accept this effort as *Ibadah* and reward us with the best of *Imaan* and good health.

LIST OF FIGURES

Figure No.		Page No.
1.1	The flowchart of work in this study.	8
2.1	The structure of cervical cancer cell line (HeLa) sourced from ATCC. The ATCC number of this cell is CCL-2. Figure A show the structure of the cells in low density while Figure B show the cells in high density. (Scale bar = 100 μ m).	14
2.2	The structure of ovarian cancer cell line (Caov-3) sourced from ATCC. The ATCC number of this cell is HTB-75. Figure A show the structure of the cells in low density while Figure B show the cells in high density. (Scale bar = 100 μ m).	18
2.3	<i>E. longifolia</i> root (A) adapted from website Nutrient Journal, 2017 and its active components (B) (self-drawn).	21
2.4	<i>N. sativa</i> seeds (A) (self-photographed) and the structure of thymoquinone (B) (self-drawn).	25
2.5	Roselle (<i>H. sabdariffa</i>) (A) and the structure of anthocyanin (B) (reproduced with permission from (Abou-Arab, Abu-Salem, & Abou-Arab, 2011)).	29
2.6	Chemical structure of cisplatin (self-drawn).	33
2.7	Extrinsic and intrinsic pathways of apoptosis (Illustration is reproduced with permission of Wali, Masters, & Thomas, 2013). The intrinsic pathway is activated by cellular stress and lead to the activation of the BH3-only members of the Bcl-2 family (such as <i>Bim</i> and <i>Puma</i>). This initiates the apoptosis signaling by binding to Bcl-2 and Bcl-xL and release of <i>Bax</i> and/or <i>Bak</i> . This promotes the loss of mitochondrial membrane potential and triggers the release of <i>cytochrome c</i> and activates <i>caspase-9</i> , <i>caspase-3</i> and eventually lead to apoptosis. The extrinsic pathway is initiated by the activation of <i>Fas</i> . This promotes a death-inducing signaling complex in which <i>caspase-8</i> is activated by its adaptor Fas-associated death domain (<i>FADD</i>). Eventually, this activates the caspase cascade and apoptosis.	41

4.1	HeLa at 24 h (IC ₅₀ value NIL), 48 h (IC ₅₀ value 838.47 ± 27.7 µg/mL), and 72 h (IC ₅₀ value NIL) following treatment with TAF 273. Values are expressed as mean ± SD (n = 3).	75
4.2	HeLa at 24 h (IC ₅₀ value NIL), 48 h (IC ₅₀ value NIL), and 72 h (IC ₅₀ value NIL) following treatment with NSE. Values are expressed as mean ± SD (n = 3).	76
4.3	HeLa at 24 h (IC ₅₀ value NIL), 48 h (IC ₅₀ value 625.54 ± 156.31 µg/mL), and 72 h (IC ₅₀ value 586.1 ± 137.34 µg/mL) following treatment with HSE. Values are expressed as mean ± SD (n = 3).	77
4.4	HeLa at 24 h (IC ₅₀ value NIL), 48 h (IC ₅₀ value 5.41 ± 2.2 µM), and 72 h (IC ₅₀ value 4.92 ± 1.6 µM) following treatment with cisplatin. Values are expressed as mean ± SD (n = 3).	78
4.5	Caov-3 at 24 h (IC ₅₀ value NIL), 48 h (IC ₅₀ value 56.1 ± 2.6 µg/mL), and 72 h (IC ₅₀ value 5.3 ± 0.6 µg/mL) following treatment with TAF 273. Values are expressed as mean ± SD (n = 3).	81
4.6	Caov-3 at 24 h (IC ₅₀ value NIL), 48 h (IC ₅₀ value NIL), and 72 h (IC ₅₀ value NIL) following treatment with NSE. Values are expressed as mean ± SD (n = 3).	82
4.7	Caov-3 at 24 h (IC ₅₀ value NIL), 48 h (IC ₅₀ value 866.66 ± 102.63 µg/mL), and 72 h (IC ₅₀ value 666.41 ± 106.02 µg/mL) following treatment with HSE. Values are expressed as mean ± SD (n = 3).	83
4.8	Caov-3 at 24 h (IC ₅₀ value NIL), 48 h (IC ₅₀ value NIL), and 72 h (IC ₅₀ value 6.07 ± 1.87 µM) following treatment with cisplatin. Values are expressed as mean ± SD (n = 3).	84
4.9	nHOSEpiC at 24, 48 and 72 h following treatment with TAF 273 (No IC ₅₀ values but cell viability of 83.9 ± 2.7%, 81.02 ± 6.4% and 73.73 ± 9.7% at 100 µg/ml respectively). Values are expressed as mean ± SD (n = 3).	87
4.10	nHOSEpiC at 24, 48 and 72 h following treatment with cisplatin (No IC ₅₀ values but cell viability of 77.85 ± 6.3%, 86.82 ± 5.2% and 80.51 ± 2.9% at 10 µM respectively). Values are expressed as mean ± SD (n = 3).	88

4.11	The adherence of Caov-3, HeLa and nHOSEpiC following exposure to TAF 273 (5.3 µg/mL) and cisplatin (6.1 µM) for 72 h. The red arrows show the space between cells grow bigger than the untreated groups while the yellow arrows show the shrinkage of the cells (4×, scale bar = 200 µm, Evos Life Technologies).	92
4.12	Apoptotic nuclear changes observed in (A) untreated Caov-3, (B) Caov-3 treated with TAF 273 (5.3 µg/mL) and (C) Caov-3 treated with cisplatin (6.1 µM) for 72 h. Caov-3 cells stained with Hoechst 33258 (10 µg/mL) were observed with fluorescence imager under magnification of 20×.	93
4.13	Flow cytometry measurements of apoptosis of untreated Caov-3 after 48 h of incubation.	96
4.14	Flow cytometry measurements of apoptosis of Caov-3 treated with TAF 273 (5.3 µg/mL) for 48 h.	97
4.15	Flow cytometry measurements of apoptosis of Caov-3 treated with cisplatin (6.1 µM) for 48 h.	98
4.16	Flow cytometry measurements of apoptosis of untreated Caov-3 after 72 h of incubation.	101
4.17	Flow cytometry measurements of Caov-3 treated with TAF 273 (5.3 µg/mL) for 72 h.	102
4.18	Flow cytometry measurements of apoptosis of Caov-3 treated with cisplatin (6.1 µM) for 72 h.	103
4.19	Percentage of apoptosis by Annexin V-PE /7-AAD assay of Caov-3 treated with 5.3 µg/mL TAF 273 and 6.1 µM cisplatin. Statistical analysis was performed using one-way ANOVA. Values are expressed as mean ± SD. * <i>p</i> < 0.05 significantly different compared to untreated cells.	106
4.20	The cell cycle distribution of untreated Caov-3 after 72 h of incubation.	108
4.21	The cell cycle distribution of Caov-3 treated with TAF 273 (5.3 µg/mL) for 72 h.	109
4.22	The cell cycle distribution of Caov-3 treated with cisplatin (6.1 µM) for 72 h.	110
4.23	Cell cycle analysis by Propidium iodide staining of Caov-3 treated with TAF 273 (5.3 µg/mL) and cisplatin (6.1	113

μM) for 72 h. Statistical analysis was performed using one-way ANOVA. Values are expressed as mean ± SD. **p* < 0.05 significantly different compared to untreated group.

4.24	The RNA integrity test of untreated Caov-3 and Caov-3 treated with TAF 273 (5.3 μg/mL) and cisplatin (6.1 μM) for 72 h using agarose gel in 1× TAE at 100V for 120 min.	115
4.25	The optimisation of <i>GAPDH</i> .	117
4.26	The optimisation of <i>β-actin</i> .	118
4.27	The optimisation of <i>Bax</i> .	119
4.28	The optimisation of <i>Bcl-2</i> .	120
4.29	The optimisation of <i>caspase-3</i> .	121
4.30	Expression level of pro-apoptotic protein; <i>Bax</i> , anti-apoptotic protein; <i>Bcl-2</i> and executioner caspase; <i>caspase-3</i> in Caov-3 cell line treated with TAF 273 (5.3 μg/mL) and cisplatin (6.1 μM) for 72 h which were normalized with untreated Caov-3 cells. Statistical analysis was performed using one-way ANOVA. Values are expressed as mean ± SD. * <i>p</i> < 0.05 significantly different compared to control group.	123
5.1	Suggested illustration of pathway how TAF 273 induced apoptosis in Caov-3. “Sensitizers” from BH3-only pro-apoptotic proteins bind directly to <i>Bcl-2</i> anti-apoptotic protein (solid line). The binding triggered the inhibition of <i>Bcl-2</i> proteins without the involvement of <i>Bax</i> (dashed line). The decrease of <i>Bcl-2</i> level may play a positive role in increasing the susceptibility of the cells to undergo apoptosis without the involvement of caspase through caspase-independent pathway.	139

LIST OF TABLES

Table No.		Page No.
3.1	List of general chemicals and reagents.	43
3.2	List of consumables items.	44

LIST OF EQUATIONS

Equation No.		Page No.
3.1	The formula was used to calculate the desired samples concentration.	48
3.2	The formula for cell density calculation.	52
3.3	The formula to calculate the percentage of cell viability.	55
3.4	The formula to calculate the average threshold cycle (C_T).	72
3.5	The formula to calculate the difference between the ΔC_T values of treated samples and untreated samples.	72
3.6	The formula to calculate the fold change.	72

LIST OF ABBREVIATIONS

TAF 273	standardized quassinoid-rich <i>Eurycoma longifolia</i> extract
NSE	<i>Nigella sativa</i> extract
HSE	<i>Hibiscus sabdariffa</i> extract
Caov-3	ovarian cancer cell line
SKOV-3	ovarian cancer cell line
HeLa	cervical cancer cell line
nHOSEpiC	normal Human Ovarian Surface Epithelial Cell Line
DNA	deoxyribonucleic acid
HIV	human immunodeficiency virus
DMEM	Dulbecco's Modified Eagle Medium
RPMI-1640	Roswell Park Memorial Institute-1640 Medium
FBS	Fetal Bovine Serum
PenStrep	Penicillin-Streptomycin
PBS	Phosphate Buffered Saline
DMSO	dimethyl sulfoxide
MTT assay	3-[4,5-dimethylthiazol-2-yl]-2-diphenyltetrazolium bromide assay
IC ₅₀	inhibitory concentration by half
CV	cell viability
PE	phycoerythrin
7-AAD	7-Aminoactinomycin D
PCR	polymerase chain reaction
RNA	ribonucleic acid

NIL

none

w/w

concentration

LIST OF SYMBOLS

&	And
°C	Degree Celcius
<	Less than
µg	Microgram
µL	Microliter
µM	Micromolar
mL	Milliliter
µg/mL	Microgram/microliter

CHAPTER ONE

INTRODUCTION

1.1 BACKGROUND OF THE STUDY

Cancer is a group of disease characterised by the unbalanced cell growth and death of cell together with the spread of abnormal cell. It is the major cause of fatality worldwide. The incidence and mortality reports due to cancer have been increasing despite the advancement in understanding and treating other diseases. It is estimated that in 2018, there will be 18.1 million new cancer cases and 9.6 million cancer deaths worldwide (Bray et al., 2018). According to the newest version of International Agency for Research on Cancer (IARC) under World Health Organization (WHO), in the report Globocan (2012), 14.1 million new cancer cases, 8.2 million cancer deaths and 32.6 million people were diagnosed with cancer in 2012 globally. Rate is the number of new cases or deaths per 100,000 persons per year. Meanwhile, the age-standardised rate (ASR) is defined as the rate that a population had as a standard age structure. The overall age-standardised cancer incidence rate is reported to be 25 % higher among men as compared women. In Malaysia, almost 40,000 new cases were detected in 2012 of whereby 18,000 new cases were reported from male cancer patients and 19,300 new cases were reported from female cancer patients. Around 22,000 cancer deaths were reported for both sexes in 2012 in Malaysia. From that figure, 11,300 deaths were reported from male cancer patients and 10,400 deaths were reported from female cancer patients. The ASR in males were 144.9/100,000 and 143.4/100,000 in females. Based on the ASR reported by IARC in 2012, the top 10 leading cancer for Malaysia population were the breast, colorectal, lung, cervix uteri, prostate, ovary, stomach,

nasopharynx, liver and corpus uteri. The top 5 most frequent cancer among Malaysian females reported by IARC were breast, colorectal, cervix uteri, lung and ovary cancers (IARC, 2012).

Gynaecological malignancies contribute to the high cases of fatality among women in Malaysia. Globally, in 2012 cervical cancer is ranked as the fourth most common cancer among women and the seventh for overall cancer with almost 530,000 new cases and 265,672 death reported. At the same time, the ovarian cancer is ranked as the seventh most common cancer among women and the ninth for overall cancer with 238,719 number of incidence and 151,917 death reported (IARC, 2012). In Malaysia, cervical cancer is the third leading cancer with 2,145 number of incidence and 621 mortality cases reported while ovarian cancer is the fifth leading cancer with 1,098 incidence and 645 mortality cases reported in 2012 (Globocan, 2012). Globally, in 2018, it is estimated that there will be almost 600,000 new cases and 311,000 number of deaths due to cervical cancer. While almost 300,000 new cases and 185,000 number of deaths will be reported due to ovarian cancer (Bray et al., 2018). Of all gynaecological malignancies, epithelial ovarian cancer is the most lethal type of cancer in women with the worst prognosis (Manimaran & Rajneesh, 2009; Johari, Sidek, Othman, & Anuar, 2013). With the high incidence cases reported, the cervical and ovarian cancers remain in the top five of common cancer among women in Malaysia despite the advance treatment given to the patients. Hence, the treatment of these two types of cancers are worth investigating in order to identify new anticancer agents that can potentially reduce the number of cases.

In Malaysia, the natural resources have long been applied or consumed as the remedies for multiple diseases and improvement of health-related conditions. The usage of plants as healing medium or supplements has been based on the perception that plant-

based remedies are safer than conventional drugs due to the natural origin of former. Plant-derived natural products have held a great promise in providing invaluable lead compounds for the development of new potential drugs (Ramasamy et al., 2011). Nowadays, most of cancer research works on the treatment which derived from natural sources. Numerous natural products and their analogues have been identified as potent anticancer agents. Based on various previous researches, a broad range of diseases such as lymphomas, skin carcinomas, cancer of breast, testicular, ovarian, head and neck have applied natural products as the treating agent (Demain & Vaishnav, 2011). Hence, it could be perceived that anticancer agent based from natural sources may widen the choices in searching for the new alternatives in decreasing the occurrence of cancer.

1.2 PROBLEM STATEMENT

The current treatment of cancer includes the surgical removal and radiation treatment followed by systemic chemotherapy to maintain the efficacy. The main challenges of chemotherapy are the recurrence of cancer associated with resistance to drugs and severe side effects that can limit the administration of anticancer agents, thus affecting the quality of life for cancer patients. Despite these disadvantages, chemotherapy is still widely used as a the treatment for all cancers and at every stage of cancer progression (Rayan, Raiyn, & Falah, 2017).

Cisplatin is a well-established chemotherapeutic drug that has been used for the treatment of several cancers including the ovarian and cervical cancers (Dasari & Tchounwou, 2014). The mode of action for cisplatin is related with the cross-linking of DNA such as interference of DNA repair mechanism, initiation of DNA damage and eventually induction of the apoptosis in cancer cells (Marsh et al., 2007; Dasari &
